1. *advantage, sorting and separation, devices, require, flow*

Knoll believes the ability of the motors to size-selectively transport nanoparticles without a net fluid will make the devices ideal for particle“The fact that our motor does not a fluid flow is a huge because flow-based need to be operated at high pressures,” added Knoll.

2. *to separate, devices, requires, ideal,*

As a separation device, it has an extremely small footprint and only a few volts of electric potential, which makes it for mobile or handheld lab-on-chip, according to Knoll. In contrast, electrophoresis which is commonly used to proteins or nucleic acids requires well above 100 Volts.

3. *applications, device, input and output, chip, biomaterials*

To become a viable commercial, the device will have to be integrated into a microfluidic that will enable control of the ports. It will also have to be bigger, in the centimeter range in order to reach interesting throughputs for Finally, for real word applications, surfaces will need to be covered to guard against unwanted deposition of

A 3-D odour-compass for odour-detecting robots

Odour-sensing robots offer many benefits over the current use of animals in similar roles, including safety, efficiency and durability. **(A) However, the robots which have been developed to date are limited** by the fact that they can only accurately detect and navigate towards odour plumes if they are within direct “sight” of the chemical source. Clearly, in real world situations, obstacles may well impede the robot’s detection ability, and at present, odour-sensing robots are therefore only of limited use. **(B) The proposed research will concentrate on developing** a robot which is able to gather readings in three dimensions and therefore overcome the limitations of current models in odour-detection. **(C) This technology will make robots a more effective substitute for animals.**

(D) This research aims to develop existing robotic technology to create a three-dimensional (3-D) odour-compass to be used as a navigation tool in searching for an odour source. **(E) This will then be tested experimentally** in simulated environments where wind direction is not stable or where obstacles interfere with odour distribution. A second stage in the research will be to develop the robot’s environmental sensors, thus allowing it to safely negotiate the terrain to reach the source of the odour. **(F) This should produce a robot which is able** to both detect and move to the source of the odour, even on difficult terrain.
